

Object- Relational Persistence in Smalltalk

Alan Knight (knight@acm.org)

Cincom Systems of Canada

What is GLORP

- ◆ **Generic Lightweight Object-Relational Persistence**
- ◆ **Open-source library for O/R mapping**
 - ◆ LGPL(S)
- ◆ **Camp Smalltalk project**
 - ◆ Sponsored by The Object People (2000)
 - ◆ Portable
- ◆ **Planned as one part of major overhaul of Object Lens**

Motivating Example

- ◆ **Cincom internal application**
- ◆ **Widely used internally and by customers**
- ◆ **Critical**
- ◆ **Relatively simple model**
 - ◆ 19 tables
 - ◆ somewhere between 12 and 46 domain classes
- ◆ **Client-server (although server functionality desirable)**

Issues

- ◆ **Schema changes extremely difficult**
- ◆ **"Interesting" schema**
- ◆ **Performance critical**
- ◆ **Some operations over very high-latency links**
- ◆ **Significant amounts of data**
- ◆ **Versioning schema, heavily linked data**
- ◆ **Must support multiple databases**

- ◆ **Demo**

Relationship Example

```
(aDescriptor newMapping: ToManyMapping)
  attributeName: #methods;
  referenceClass: StoreMethodInPackage;
  useLinkTable;
  join: (Join
    from: primaryKeyField
    to: methodsTable packageRefField).
```

```
methodMapping query alsoFetch: [:each |
  each definition].
```

```
methodMapping query expectedRows: 1000.
```

- ◆ Note that Join defines read, write, and join.
- ◆ Note optimizations

Packages and Classes

- ◆ In Store, "Package" means one version
- ◆ "Class" means ClassDefinition
- ◆ Entities in database are not like traditional in-memory entities
 - ◆ e.g. what package contains this method
- ◆ Introduce additional entities
 - ◆ StoreVersionlessPackage
 - ◆ StoreMethodInPackage (etc)
 - ◆ StoreClassExtension
- ◆ Clearer domain model, ability to express queries

Demo 2

- ◆ **Querying UI**
- ◆ **Replicating**
- ◆ **Browsing**
- ◆ **Optimizations**
- ◆ **Caching**

Writing

- ◆ **Unit of Work**
- ◆ **Purely transactional**
- ◆ **No explicit writes**
- ◆ **In-memory rollback**
- ◆ **Automatic insert/update**
- ◆ **Automatic write order/referential integrity**
- ◆ **Mostly automatic database transactions**
- ◆ **Optimized**

Notable Technical Points

- ◆ **Object-level rollback in Unit of Work**
- ◆ **RowMaps and write optimization**
- ◆ **Block to expression conversion**
- ◆ **Joins**
 - ◆ **declarative - defines the table relationship**
 - ◆ **simple**
 - ◆ **handles all uses**

Acknowledgements

- ◆ **The Object People**
- ◆ **Cincom**
- ◆ **All the contributors and users of GLORP**

Reading non-Object Data

- ◆ Reading pure data, ordering
 - query := Query readManyOf: StorePackage.
- ◆ Aggregate functions
 - query orderBy: [:each | each name].
 - query retrieve: [:each | each name distinct].
 - query retrieve: [:each | each primaryKey max].
- ◆ Retrieving pieces of objects
 - query retrieve: [:each | each id].
 - query retrieve: [:each | each name].
 - query retrieve: [:each | each address] (changing contexts)
- ◆ Note: All internal queries generated by user-accessible mechanisms.

Change Hats: VisualWorks

◆ Next-generation database frameworks, inputs

◆ VisualWorks Object Lens

- ◆ Strong in many respects, but very dated
- ◆ Client-server orientation

◆ Object Studio POF

- ◆ Very strong modelling

◆ GLORP

- ◆ Open-source
- ◆ Extremely flexible mapping layer

◆ SQLWorks

- ◆ Good server orientation
- ◆ *very* high-performance

◆ Goal: Synthesize the best of all these

Core Issues

- ◆ **Object identity vs primary keys**
- ◆ **Pointers vs. foreign keys**
- ◆ **Networks of objects vs. rows**
- ◆ **Queries vs. traversing relationships**
- ◆ **Encapsulation vs. program independence**
- ◆ **nil is not null**
- ◆ **The role of the application**

Incidental Issues

- ◆ **Keys: natural vs. generated**
- ◆ **Integrity constraints**
- ◆ **Inheritance**
- ◆ **Mismatched schemas**
- ◆ **Agility**

General Database/Multi-User Issues

- ◆ **Scaling**
- ◆ **When to read data?**
- ◆ **What do queries look like?**
- ◆ **Performance, performance, performance**
- ◆ **Locking**
- ◆ **Caching, refreshing, keeping data in sync**
- ◆ **Transaction semantics (knowing which transaction to use)**
- ◆ **Transaction lengths**
- ◆ **Multi-user within an image?**

Approaches

- ◆ **Metadata or code generation**
- ◆ **Associating objects with transactions**
- ◆ **SQL, OO query language, objects as queries, special syntax**
- ◆ **Explicit or automatic writes**
- ◆ **Marking objects dirty**
- ◆ **When to take objects out of cache**
- ◆ **Different framework architectures (e.g. brokers, subclassing)**

GLORP Licensing

◆ LGPL (Lesser GNU Public License)

- ◆ Can be used as a library, does not affect linked code
- ◆ Modifications must be released under the same license

◆ But...

- ◆ LGPL's terminology very difficult to interpret with respect to Smalltalk.

◆ Approach

- ◆ Include a clarification with GLORP, specifying a sensible Smalltalk interpretation of the license
- ◆ Copyright held by the authors/not assigned
- ◆ Counsel: Lawrence Rosen (also general counsel of OSI)
